

Naming preview report
2026-05-01

Your naming report

Independent operators rebuilding their brand identity for a relaunch.

25 candidates generated.
Top 5 personalized to your answers.
All candidates and methodology included.

What this report is, and what it is not

A name matters. It does not matter as much as the marketing literature implies. The research evidence puts name-attributable variance in commercial outcomes at somewhere between 3 and 10 percent in well-controlled studies, and probably less in real markets where advertising spend, distribution, product quality, and timing dominate. The naming industry routinely implies the number is closer to 30 to 50 percent. That gap is real, and it shapes how we built this tool.

You will see 5 names below personalized to your answers. The system also generated 25 other candidates, included later in this report. We rate them on real signals (.com availability, pronounceability, length, typology, tonality fit), not on guarantees about commercial outcomes. Pick a name you can live with for years. The rest of the brand work matters more.

Your top 5

SampleA1 descriptive

.com availability unknown or owned

Sample rationale for candidate 1, position descriptive, written long enough to give the PDF body something realistic to wrap.

Worth flagging:

- In a crowded space, descriptive names like this one are harder to make stick.

SampleB2 suggestive

.com owned, about \$500 to acquire

Sample rationale for candidate 2, position suggestive, written long enough to give the PDF body something realistic to wrap.

SampleC3 associative

.com owned, about \$4,500 to acquire

Sample rationale for candidate 3, position associative, written long enough to give the PDF body something realistic to wrap.

Worth flagging:

- The .com is owned and runs about \$4,500 to acquire.

SampleD4 abstract

.com availability unknown or owned

Sample rationale for candidate 4, position abstract, written long enough to give the PDF body something realistic to wrap.

SampleE5 descriptive

.com availability unknown or owned

Sample rationale for candidate 5, position descriptive, written long enough to give the PDF body something realistic to wrap.

Worth flagging:

- In a crowded space, descriptive names like this one are harder to make stick.

All candidates

Grouped by typological position, sorted by reweighted score within each group.

Descriptive

7 candidates

SampleA1 (.com owned)
SampleE5 (.com owned)
SampleI9 (.com owned)
SampleM13 (.com owned)
SampleQ17 (.com owned)
SampleU21 (.com owned)
SampleY25 (.com owned)

Suggestive

6 candidates

SampleB2 (.com owned, ~\$500)
SampleF6 (.com owned, ~\$500)
SampleJ10 (.com owned, ~\$500)
SampleN14 (.com owned, ~\$500)
SampleR18 (.com owned, ~\$500)
SampleV22 (.com owned, ~\$500)

Associative or metaphoric

6 candidates

SampleC3 (.com owned, ~\$4,500)
SampleG7 (.com owned, ~\$4,500)
SampleK11 (.com owned, ~\$4,500)
SampleO15 (.com owned, ~\$4,500)
SampleS19 (.com owned, ~\$4,500)
SampleW23 (.com owned, ~\$4,500)

Abstract or coined

6 candidates

SampleD4 (.com owned)
SampleH8 (.com owned)
SampleL12 (.com owned)
SampleP16 (.com owned)
SampleT20 (.com owned)
SampleX24 (.com owned)

How this works

Generation

Each request runs four parallel calls to a generative model, one per typological position. Each call asks for around 25 candidates of one position with strict naming rules. The four batches merge into a single pool. The pool then runs through availability checks on .com and a six-dimension scoring rubric.

What we filter

Names that fail length, character, or forbidden-suffix rules are dropped during validation. Names that own the .com but cost more than ten thousand dollars to acquire are excluded from the scored slider; they appear in this PDF as "owned" with a flag. The slider you saw is the top 25 of the validated pool by composite score.

What we did not optimize for

AI search optimization, social handle availability, voice search compatibility, brand voice integration, and 50-language linguistic vetting are not in this report. The evidence base for those is either too thin to support strong claims (AI search) or only meaningful for global brand launches (linguistic vetting). For a small operator picking a domain name, those dimensions distract more than they help.

Binary versus soft

Domain ownership is binary: you own the .com or you do not. Everything else is soft: pronounceability, memorability, tonality fit. We treat the binary feasibility constraint as a hard gate and report the soft factors with appropriate magnitude language. The naming industry habitually conflates these, and that conflation is what produces report outputs that promise more than the evidence supports.

The full methodology document, including the research the tool is built on, is published at codyasmith.com/naming/methodology.
